

ANALYSING THE LAWS RELATING TO REGULATION OF GMOs IN INDIA

*By Ishan Rana
From Alliance School of Law, Bangalore*

ABSTRACT

The debate over the coterminous effects of genetically modified organisms on the environment has been raging on in the recent years both in India and the international arenas. In the past decade alone, there has been a substantial rise in the number of groups that take a stand against the release of such organisms into the food chain. This opposition to the development and sale of genetically modified organisms has been, to date, successfully countered by the lobbying juggernaut of the major players in the genetic engineering industry who seek to capitalise on the established advantages of such organisms like higher yielding capacity and higher resistance to pests and diseases in the case of genetically modified agricultural crops. The primary objective of this paper is to present an overview of the law on regulation and release of genetically modified organisms. A brief discussion about the existing legislations has been attempted which is followed by a concise account of the functions of the regulatory committees on GMOs. An account of the associated liabilities and remedies that flow with the GMOs and transgenic products has also been provided. The precautionary principle which forms the backbone of the machinery deciding the deployment of precautionary action has also been elucidated. Lastly, with a forward looking perspective the merits and lacunae of the Biotechnology Regulatory Authority of India Bill has been explained

with recommendations proposed for the emendation of the Bill.

Keywords: genetically modified organisms, precautionary, biotechnology regulatory authority of India bill.

CHAPTER I

1. INTRODUCTION

1.1 OVERVIEW

In the past decade alone, there has been a substantial rise in the number of groups that take a stand against the release of such organisms into the food chain. This opposition to the development and sale of genetically modified organisms has been, to date, successfully countered by the lobbying juggernaut of the major players in the genetic engineering industry who seek to capitalise on the established advantages of such organisms like higher yielding capacity and higher resistance to pests and diseases in the case of genetically modified agricultural crops.

The propaganda against and in support of genetically modified organisms is dangerous as it leads to the formation of an extremely reductionist view of the issue in the eyes of a layman who either sees the strictly against or staunchly for stance of the interest groups involved. Education regarding the existence of a common ground between the two stands needs to be imparted. It has become an imperative objective to inform the layman about the credible advantages and potential disadvantages of introducing a product of human intervention in the process of evolution and natural selection.

India's current legislative framework with regard to genetically modified organisms is arguably panoramic with statutes spanning the fields of science and technology, environment and its preservation, agriculture and its advancement, food and health and also the trade of GMOs. Almost all the frameworks dealing with the regulation of GMOs have been briefly discussed in the following part of the paper. The only exceptions worth mentioning are the Patent Act, Biological Diversity Act, and Plant Variety Protection and Farmers' Rights Act which are remotely linked to the issue at hand but do not have the machinery expressly concerned with the regulation and release of GMOs.

1.2 RESEARCH PROBLEM

The debate over the environmental impact of genetically modified (GM) crops is becoming progressively mind boggling, serious, and extremely emotional. It is further complicated as new technology and research is done. Evaluating the environmental impact of GM crops is frequently troublesome as many factors are considered. The paper aims to present an overview of the law on regulation and release of genetically modified organisms.

1.3 EXISTING LEGAL SITUATION

Now-a-days with the rapid advance research and development in agricultural biotechnology, countries are approving many genetically modified crops for commercial release and agricultural production. ISAA

reported in 2017, the 21st year of commercialization of biotech crops, 189.8 million hectares of biotech crops were planted by up to 17 million farmers in 24 countries. From the initial planting of 1.7 million hectares in 1996 when the first biotech crop was commercialized, the 189.8 million hectares planted in 2017 indicates 112-fold increase.¹

In India, Bt cotton was approved by Government of India in March 2002 as the first transgenic crop for commercial cultivation for a period of three years. Apart from cotton, there are more than 20 crops under research and development in about 50 public and private sector organizations in India. Out of these, 13 crops have been approved for contained limited field trials in India.²

1.4 REVIEW OF LITERATURE

Drew L. Kershen in his paper 'Of Straying Crops and Patent Rights' talks about genetically modified crops which hold an inherent potency of causing a genetic contamination which might onset claims of nuisance, negligence and strict liability against the farmers and the developers of the seeds. Adding to that his next paper on 'Agricultural Biotechnology: Legal Liability Regimes from Comparative and International Perspectives' says that the other torts are also included in it namely trespass he wrote this paper with another author named Stuart J. Smyth.

¹ Transgenic Crops-Biosafety Concerns and Regulations in India <
<http://vikaspedia.in/agriculture/crop-production/advanced-technologies/transgenic-crops-biosafety-concerns-and-regulations-in-india>>
Accessed 21. September 2019.

² Biotech Crop Highlights in 2017 <
<https://www.isaaa.org/resources/publications/pocketk/16/>> Accessed 21 September 2019.

Stuart J. Smyth said any economic loss resulting from physical contamination caused by the adulteration of seeds by unapproved substances and loss of markets caused thereby are valid claims for instituting suits on tort of negligence, private nuisance and public nuisance as well.

David Kriebel, in his paper of 'The Precautionary Principle in Environmental Science', spoke about precautionary principle and the four primary objectives of the precautionary principle which are - enforcement of preventive measures in situations of scientific uncertainty, transpose the burden of proof on the exponents of an inherently harmful activity, probe for the alternative procedures to achieve the same goal and involve the invested participants in the decision making process. *Anne I. Myhr*, in 'The Precautionary Principle in GMO Regulations' also spoke about the precautionary principle and the practical projections of the principle's objectives and how it remains controversial to their varied interpretation.

Also *S.M. Garcia*, in 'The Precautionary Principle: its Implications in Capture Fisheries Management' spoke about the Rio Declaration 1992, which states that "in order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall be not used as a reason for postponing cost-effective measures to prevent environmental degradation". The author also says that articulation of the approach is similar to that of the principle and the only variance exists in that firstly, the Rio Declaration recognises that there may be differences in local

capabilities to apply the approach and secondly, that it appeals for the accounting of economic and social costs.

David J. Schnier, in his study and paper 'Genetically Modified Organisms and the Cartagena Protocol' talks about the Cartagena Protocol on Biosafety to the Convention on Biological Diversity which has promulgated one of the most robust references to the precautionary principle in contemporary international law. The protocol is the first of its kind to expound the precautionary principle outside of its preamble i.e., delineate the principle in its operational titles. According to the author, the consequence of this the Protocol has been credited with "propelling the precautionary principle to the forefront of international environmental law".

Dhan Prakash, Professor at Amity University, Amity Institute of Herbal Research and Studies examines the various risks associated with biotechnology in his article *Risks and Precautions of Genetically Modified Organisms* (2011). Prakash states that the introduction of genetically modified organism can create hazards for ecological stability (2011). Genetic contamination, competition with natural species, and the inability to control genetically modified organisms once they are released into the ecosystem all present potential problems. Prakash sees biotechnology as a paradox, "The use of genetically modified organisms is important in order to meet increasing demands and improve existing conditions prevalent in our environment. We are at an anxious juncture where, on one hand, we are faced with unprecedented threats to human health and environment, while on the other hand we have opportunities to change the

way things are done” (2011).³ While Prakash states that there are potential human health risks associated with biotechnology, he does not elaborate.

Further the Recombinant DNA safety guidelines, 1990 speaks that, the environmental release, the geographical position of the site, the dimensions of the area, the expected effects on the ecosystem in the proximity of the site, the method and quantity of the release and contingency plans need to be made out prior to the release and assessment of the risks associated with the release needs to be made on a case-by-case basis before the release.

The National Biotechnology Regulatory Bill, 2008 says that BRAI also establishes that it does not have jurisdiction with respect to any matter which the appellate tribunal under the bill is empowered to decide further also no injunction can be granted by any court in respect of any action taken under the Act. It also adds that the provisions that make the bill are almost unimpeachable as very limited space is provided for interventions and the conventional mechanisms have been completely dismantled.

1.5 SCOPE AND OBJECTIVES

The scope of the present study is mainly focused on the framework of the legislation regarding the GMOs and the liabilities associated with it. The main objective of the paper is to evaluate the laws and how certain principle or bill are being the backbone to support the regulation of GMOs in India. Further, it will try to focus on specific liabilities like liability under tort, general

environmental liability etc. Finally, it will try to focus on how the precautionary principle is needed to protect the environment and future it will talk about what recommendations are needed on the BRAI Bill 2013.

1.6 RESEARCH QUESTION

1. Is the Precautionary Principle needed to protect the Environment?
2. What are the recommendation on the BRAI Bill?

1.7 HYPOTHESIS

- Principle 15 of the Rio Declaration, 1992 states the precautionary principle: “in order to protect the environment, the precautionary approach shall be widely applied”.
- Biotechnology Regulatory Authority of India Bill encroach upon the legal rights of the farmers and the consumers generally.

1.7 RESEARCH METHODOLOGY

Considering the objective of the paper the ‘qualitative research method’ is applied. Qualitative research is generally more explorative, that is dependent on the collection of verbal, behavioral or observational data that can be interpreted in a subjective manner.

CHAPTER II

2. LAW AND LIABILITIES

2.1 FRAMEWORK OF LEGISLATIONS

The regulations pertaining to biosafety in India constitutes primarily of the biosafety

³ Dhan Prakash, ‘Risks and Precautions of Genetically Modified

Organisms (2011) <<https://erikrothrichmond.wordpress.com/tag/gmo/>> Accessed 24 September 2019.

rules and guidelines. However, the central legislative authority for biosafety regulations in the country is arguably the Environment (Protection) Act, 1986.⁴ The sections 6, 8 and 25 of this Act jointly form the preamble through which all the currently existing biosafety regulations flow in India. Section 6 of the Act gives the authority to the Central Government to form the essential rules on the standard procedures, implement safeguards and place the necessary restrictions for handling of hazardous substances and outright prohibit the others. On the other hand, Section 8 of the Act imposes a prohibition on a person from handling any substances considered to be hazardous under the Act except when the procedures and safeguards have been complied to. Lastly, the Section 25 of the Act places the responsibility of stipulating the rules regarding procedures and safeguards for handling hazardous substances⁵ on the Central Government. As a direct consequence of this, the general consensus in the Indian Judicial System is that the biosafety rules are of a statutory nature as their genesis lies in the abovementioned provisions of the Environment (Protection) Act. These abovementioned provisions have also lead to the promulgation of the 1989 Biosafety Rules by the Ministry of Environment and Forests.

The 1989 Biosafety Rules apply to the products made from genetically engineered micro-organisms and other gene-technology produce and regulates their manufacture, storage and import. These Rules also cover the pre-release facet of genetically modified organisms, namely their research and

development besides the large scale applications and trials. Hazardous organisms which are not genetically modified are also regulated by the 1989 Biosafety Rules. The Rule 8 of this statute mandates the requirement of an approval by the regulatory bodies prior to the discharge or even the production of genetically modified organisms and cells. The Rules no. 10 and 11 necessitates the requirement of an approval for any such substances that contain genetically engineered organisms or even cells. However, the Rule 9 of this statute is the foremost in significance as it expressly prohibits the deliberate and/or unintentional discharge of genetically modified organisms (for experimental purposes) covered under its schedule, barring a situation where it has been approved as a 'special case' by the appropriate authority. The abovementioned schedule is a feature of the 1989 Biosafety Rules which classifies human and animal pathogens in terms of their risk profiles.

The 1989 Biosafety Rules have been augmented aptly by the Biotechnology Safety Guidelines which have been put into effect by the Department of Biotechnology.⁶ The Biotechnology Safety Guidelines are the consequence of Rule 4(2) of the 1989 Biosafety Rules which mandates the requirement of guidelines manuals which are to be stipulated by the Review Committee on Genetic Manipulation. This committee is a departmental off-shoot of the, and serviced by the Department of Biotechnology. These guidelines are concerned with the assessment of biosafety levels of which it carries a detailed admonishment

⁴ The Indian Environment (Protection) Act, 1986.

on recombinant DNA or rDNA related activities, experiments, shipments and quality control produced by genetic engineering is also provided. The Biotechnology Safety Guidelines, before reaching its current form and after being issued by the Department of Biotechnology in 1990 were revised and emended two times and finally amended in 1998 in accordance with the progressive strides made in the field of rDNA research.

2.2 GENETICALLY MODIFIED ORGANISMS AND ASSOCIATED LIABILITIES

Presently, there does not exist any specialised statute that deal with genetically modified organisms and the liabilities arising out of the misappropriate handling or use of such organisms in India. However, there exists effective legal machinery that ensures the awarding of appropriate legal remedies to the aggrieved persons. Instances where damage and injuries caused by the misapplication of genetically modified organisms and violation or oversight of any biosafety regulation can be discerned with the aid of specific legal provisions and precedents of the judiciary.

Specific GMO Liability Provisions

If a measure adopted by the defendants is found to be in contravention of the 1989 Biosafety Rules, then the section 15 of the Environment (Protection) Act, 1986 is attracted. Such a failure to concur with the Biosafety Rules is punishable by an imprisonment term extending to not more than five years or a fine not extending the amount of one Lakh rupees or both. An

additional fine can be imposed if such a contravention of the Biosafety rules continues and this amount shall not exceed five thousand rupees for every day. The court has the authority to take cognizance under section 15 of the Environment (Protection) Act, 1986 only on a complaint instituted by either the central government or an officer authorized on its behalf and even a person who has given a due notice of a minimum of sixty days in the prescribed manner to the central government or an authorised officer.⁷

However, the general consensus regarding the liability provisions under the Act is that they are tenuous and time consuming. Any genera or species that involve the use of 'any technology' which makes them potent to either the life or health of human beings, animals and plants cannot be registered under the Protection of Plant Varieties and Farmers' Rights Act, 2001.⁸ The explanation of the sub-section clarifies that the term 'any technology' includes the genetic use restriction and terminator technology. The Environment (Protection) Act, 1986 deals specifically with the liability arising from the non-performance of a propagating material that is registered under the Act. The developers of such varieties are duty-bound to make a disclosure to the farmers about the expected performance under differential conditions. Upon the failure of the developers to do so, the aggrieved farmers can institute a suit for damages before the Plant Variety Protection Authority under the Act⁹, which has the authority to award compensations accordingly.

General Environmental Liability

⁷ The Indian Environment (Protection) Act, 1986 (Act 29 of 1986), s. 19.

⁸ The Indian Environment (Protection) Act, 1986 (Act 29 of 1986), s. 29(3).

⁹ The Indian Environment (Protection) Act, 1986 (Act 29 of 1986), s. 39(2).

The Articles 32 and 226 of the Constitution of India are the legal pathways through which the fundamental rights guaranteed under part III of the Constitution can be enforced by any qualified citizen or a legal person under certain cases. The Article 32 is invoked to move the Supreme Court and likewise Article 226 is invoked to move any particular High Court under the jurisdiction of India. Both of these courts are clothed with the power to issue appurtenant writs for the enforcement of fundamental rights and as a remedial measure for their infringements. The apex court has by way of its pronouncements, which have had the effect of considerably relaxing the rule of locus standi, has opened a plethora of public interest litigations seeking to enforce the fundamental rights of the socially and economically handicapped who were previously inept to approach the courts. Furthermore, the increasingly broadening horizon of the interpretations under the head of Article 21 has brought to the fore previously unimportant rights like the right to a clean environment and the right to health. This has further enabled persons to approach the High Courts or the Supreme Court for the remedy of the violations of such rights. The remedial measures employed by the courts involve the closure of polluting establishments and mandatory requirement of caution deposits, following the final report of fact-finding commissions constituted by the respective courts. A number of judicial pronouncements have emphasized the requirement of establishing specialised 'environmental' courts across the nation to handle the complicated issues with

expertise.¹⁰ The environmental liability principles are primarily built up on Supreme Court judgments like the precedent of *M.C. Mehta v. Union of India*¹¹. In this case, the apex court examined the absolute and strict liability of enterprises in the event of an accident particularly if the respondent is engaged in hazardous or inherently dangerous industry. The court also examined the rule laid down in the *Ryland v. Fletcher*¹² case and was of the opinion that this rule was archaic as it was promulgated in a period when science wasn't as developed and hence this precedent was inept for accounting the "present day economy and social structure". Consequently it was held that an enterprise that causes harm as a result of any accident is strictly and absolutely liable to compensate the affected. This liability¹³ was held to not be subjected to the exceptions allowed under the *Ryland v. Fletcher* rule.

As regards the factor of accounting for the amount of damages to be paid by the violating enterprise, it has become an established practice to keep the amount payable to be directly proportional to the capacity and wealth of the violators. The objective for awarding a compensation of such a nature is to create deterrence among the enterprises handling hazardous substances. In *Union Carbide Corporation v. Union of India*¹⁴ the Supreme Court dismissed the precedents set in the Oleum Gas Leak case as obiter dicta citing the fact that a conclusion about the status of the defaulting company under Article 12 of the Constitution was not drawn. However, the

¹⁰ Law Commission of India, 186th Report on Proposal to Constitute Environment Courts (September, 2003)

¹¹ *M.C. Mehta v. Union of India* 1987 SCR (1) 819

¹² *Ryland v. Fletcher* (1868) UKHL 1.

¹³ The Public Liability Insurance Act, 1991 (Act 6 of 1991).

¹⁴ *Union Carbide Corporation v. Union of India* 1990 AIR 273.

apex court adopted a different point of view while deciding in the matter of *Indian Council for Enviro-Legal Action v. Union of India*¹⁵. It was observed by the Hon'ble court that although the court hadn't directed any specific damages to be paid in the Oleum Gas Leak case, the bench had dictated that cases on the basis of the principle of absolute liability can be instituted. Therefore, the apex court in the Indian Council for Enviro-Legal Action case followed the principles of absolute liability in discerning the immediate issues of the matter. Concurrently, it was also observed by the court that damages based on the absolute liability principle must account for the costs of restoring the environmental degradation besides the compensation for the victims. On the other hand, in *M.C. Mehta v. Kamal Nath*¹⁶, the perspective adopted by the Supreme Court was to view pollution as a tortious act against the 'community as a whole'. The court also awarded exemplary damages to be paid by the respondent. Thus, it can be reasonably inferred that the guilty party is liable to pay damages to the victims who have suffered loss and the same should also account for the restoration of the ecology and environment. A classification of different types of liabilities associated with pollution was attempted by the Supreme Court in the case of *K.M. Chinnappa v. Union of India*¹⁷. The court categorized the liabilities as follows: (i) criminal liabilities through which imprisonment sentences can be awarded; (ii) administrative sanctions; (iii) costs for clean-

up of the pollution caused; (iv) civil liability based on the principle of strict liability; and (v) adverse publicity. In the case of *Research Foundation for Science Technology and Natural Resources Policy v. Union of India*¹⁸, the polluter pays principle was further clarified by the Supreme Court. It was held that this principle includes the costs for preventing and tackling any pollution caused by the polluter.

Liability under Law of Tort

The liability under law of tort, in majority of the cases, can be traced to the pernicious effects which result from mixing of genetically modified organisms with unmodified or 'natural' organisms and even due to the supplanting of genetically modified plants as substitutes or volunteers. However, given that pollen transfer is a biological phenomenon, in order to determine liability, some damage needs to be proved. To date, no specific precedents have been established in India. Thus, reliance can be made on analogical deduction from trends set in the United States and Canada. These trends show that suits have been instituted by non-transgenic plant growers against the developers of genetically modified plants or crops. The genetically modified crops hold an inherent potency of causing a genetic contamination that might onset claims of nuisance, negligence and strict liability against the farmers and the developers of the seeds.¹⁹ Claims pertaining to trespass²⁰, and

Accessed 23 September 2019.

²⁰ Stuart J. Smyth and Drew L. Kershen, 'Agricultural Biotechnology: Legal Liability Regimes from Comparative and International Perspectives' (2006) 6

nuisance²¹ based suits, have failed thus far in both the American as well as Canadian courts. However, suits resulting from negligence have found considerable success in establishing precedents and it has been held that it is reasonable to expect a duty of care from persons handling genetically modified organisms. A breach of that duty would invite liability on the basis of negligence. Any economic loss resulting from physical contamination caused by the adulteration of seeds by unapproved substances and loss of markets caused thereby are valid claims for instituting suits on tort of negligence, private nuisance and public nuisance as well.²²

As many as five instances can be anticipated in United States of America and Canada based disputes where genetically modified organisms related liability might come to the fore. They are as follows:

- (i) damages arising from the admixture of GMOs with conventional crops;
- (ii) damages originating from the loss of premium for a traditional commodity or food products without GMOs;
- (iii) an admixture rendering the registered identity of the product as lost;
- (iv) damage caused due to the loss of markets and
- (v) damage from inability of a farmer to plant a crop due to the proximity of transgenic crops.²³

²² Ibid.

²³ Ibid.

²⁴ *Donoghue v. Stevenson* (1932) UKHL 100.

²⁵ Ibid.

GMOs and Product Liability

The genesis of the liability arising from products causing injury lies in the House of Lords decision of *Donoghue v. Stevenson*.²⁴ It was held that the manufacturer of a product owes a duty of care towards the consumer when he has the knowledge that there does not exist any intermediate mechanism for the examination of the manufactured product and that an omission of reasonable care on his part towards the product can cause injury to the consumer's life or property or both.²⁵

The Consumer Protection Act, 1986

The central objective behind the promulgation of this Act was to promote and protect the consumer's rights in the market. The consumer rights include but are not limited to the right to be shielded from the marketing of potentially hazardous goods; right to be informed about the quality, quantity, purity, standard and price of goods and the right to consumer education. Under the Act, all movable properties with the exception of actionable claims and money bills are considered goods.²⁶ Therefore, genetically modified organisms based products are also considered as goods under the Act. The Act also provides for a consumer²⁷ to file a complaint²⁸ against a trader²⁹ for defects in the goods sold or for the deficiency in service accompanying the sale of goods. Thus, actions against defective GMOs or the inept services accompanying them are maintainable under the Act. Suits³⁰

²⁶ Sale of Goods Act, 1930 (Act 3 of 1930), Sec. 2(7).

²⁷ The Consumer Protection Act, 1986 (Act 68 of 1986), Sec. 2(1)(d).

²⁸ The Consumer Protection Act, 1986 (Act 68 of 1986), Sec. 2(b).

²⁹ The Consumer Protection Act, 1986 (Act 68 of 1986), Sec. 2(j).

³⁰ The Consumer Protection Act, 1986 (Act 68 of 1986), Sec. 2(c).

can also be instituted against the malpractices of excessive pricing, offering sale of hazardous or potentially hazardous goods and services. Restrictive trade practices that could lead to the manipulation of prices and unfair conditions of delivery, which in turn can cause unjustified costs and restrictions for the consumer, are also covered by the Act. Fraudulent or bogus claims aimed at deceiving the consumer by misrepresenting goods and services, fall within the ambit of the Consumer Protection Act, 1986. Such a contrived representation of the standard, grade and composition of genetically modified organisms are considered to be unfair trade practice. Therefore, the marketing of GMOs without the labels indicating their grade and composition, especially when a legal requirement to label the GMOs exists, tantamount to a fallacious and bogus representation and is consequently an unfair trade practice prohibited by the Act.

made out prior to the release. Assessment of the risks associated with the release needs to be made on a case-by-case basis before the release. The Genetic Engineering Appraisal Committee bears the duty of handling and monitoring all large-scale operations involving GMOs. The applicant has to submit his operational details on the management and disposal of harmful wastes before the GEAC. The precautionary principle is a doctrine through which pragmatic resolutions can be made in situations of scientific uncertainty. There are four primary objectives of the precautionary principle:

- (i) Enforcement of preventive measures in situations of scientific uncertainty;
- (ii) Transfer the burden of proof on the exponents of an inherently harmful activity;
- (iii) Probe for the alternative procedures to achieve the same goal and
- (iv) Involve the invested participants in the decision making process.³¹

CHAPTER III

3. PRECAUTIONARY APPROACH AND BARI BILL

3.1 PRECAUTIONARY PRINCIPLE AND PRECAUTIONARY APPROACH

For the execution of an environmental release, the geographical position of the site, the dimensions of the area, the expected effects on the ecosystem in the proximity of the site, the method and quantity of the release and contingency plans need to be

However, the practical projections of the principle's objectives remain controversial due to their varied interpretations.³² Numerous versions of the principle continue to exist and essentially two formulations of the principle exist in International law- the precautionary approach and the precautionary principle.

Principle 15 of the Rio Declaration, 1992 states regarding this principle: "in order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there

³¹ David Kriebel et.al., 'The Precautionary Principle in Environmental Science', (2001) 109 Environ Health Perspect 871. <<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC1240435/>> Accessed 23 September 2019.

³² Anne I. Myhr, 'The Precautionary Principle in GMO Regulations', T. Traavik and L.C. Lim (eds.), Biosafety First Chapter 29 (Tapir Academic Publishers, 2007) <<http://genok.no/wp-content/uploads/2013/04/Chapter-29.pdf>> Accessed 23 September 2019.

are threats of serious or irreversible damage, lack of full scientific certainty shall be not used as a reason for postponing cost-effective measures to prevent environmental degradation.” The articulation of the approach is similar to that of the principle and the only variance exists in that firstly, the Rio Declaration recognises that there may be differences in local capabilities to apply the approach and secondly, that it appeals for the accounting of economic and social costs.³³ It is a general consensus that this ‘approach’ is a dilution of the more stringent ‘principle’.

Precautionary Principle in International Law

The Cartagena Protocol on Biosafety to the Convention on Biological Diversity has promulgated one of the most robust references to the precautionary principle in contemporary international law. The protocol is the first of its kind to expound the precautionary principle outside of its preamble i.e., delineate the principle in its operational titles. As a consequence of this the Protocol has been credited with “propelling the precautionary principle to the forefront of international environmental law”.³⁴

The precautionary principle firstly dictates the requirement of a minimum level of risk that warrants the application of precautionary action. Enterprises that deal with even remotely risky yet economically profitable activities often employ “higher risk-triggering levels”. The Rio Declaration

requires the existence of both threats of serious and of irreversible damage to onset a precautionary action. Whereas, the level of risk established by the Protocol is “potential adverse effects”, which tends to be significantly lesser than the levels established in the Rio Declaration. Thus, the inference that precautionary action is much easily justified under the Protocol than the Rio Declaration holds true. Secondly the Protocol makes an allowance to the responsible party during a period when precaution is triggered by making a “decision as appropriate with regard to import in order to avoid or minimize such potential adverse effects”. More importantly, the Protocol does not seek any considerations for the profits of an activity or its economical quality. By doing so, the Protocol allows for the focus on the potential harmful impacts on the biodiversity. Thirdly, and in stark contrast to the Rio Declaration’s requirement of “lack of full scientific certainty”, the Protocol only demands the “certainty” for the conjuring of the precautionary principle. This renders the need for scientific consensus before the invocation of precautionary principle mute. Furthermore, the Protocol also necessitates the need for subjecting the decisions made to the assessment of risk.

Article 15(3) of the Protocol states that parties may ask the exporters to carry out the requisite risk assessments which will consequently enable the developing economies of the world to promulgate measures constituted on the precautionary

³³ S.M. Garcia, ‘The Precautionary Principle: its Implications in Capture Fisheries Management’ (1994) 22 Ocean Coast Manage 99. <https://core.ac.uk/download/pdf/39857159.pdf> Accessed 23rd September 2019

³⁴ David J. Schnier, ‘Genetically Modified Organisms and the Cartagena Protocol’ (2001) 12 Fordham Envtl. L.J. 377. <https://ir.lawnet.fordham.edu/cgi/viewcontent.cgi?referer=https://www.google.com/&httpsredir=1&article=1551&context=elr> Accessed 23 September 2019.

principle, even in a situation where they do not possess the administrative machinery to perform those risk assessments themselves. Although the Protocol does not mandate the requirement of scientific knowledge and consensus for taking precautionary action, this should not be construed as the existence or non-existence of a risk. Notwithstanding such articulation in the Protocol, risk assessments are to be conducted on a case-by-case basis and in a manner that conforms to the principles and laws of the associated science.

In postlude it can be summarised that the Precautionary Principle has an ambiguous language which makes it difficult to discern the acceptable levels of risks, how such potentially harmful trade-offs should be addressed, and what measure of scientific evidence is adequate in deriving at decisions.

Precautionary Principle in India

The precautionary principle is not promulgated by any explicit statutory authority in India. The resulting lacunae in biosafety regulations is however supplanted by judicial pronouncements of the Supreme Court which has adopted the matrix of the principle in adjudicating legal disputed regarding genetically modified organisms. In *Vellore Citizens' Welfare Forum v. Union of India*³⁵, the polluter pays principle and the precautionary principles were held to be indispensable parts of promoting sustainable development in India. The precautionary principle from the perspective of municipal law would suggest that:

- (i) Authorities have to 'anticipate, prevent and attack the causes of environmental degradation;
- (ii) No postponement of cost effective measures in the face of scientific uncertainty and irreversible consequences; and
- (iii) The proponent bears the burden to prove that a proposal is environmentally friendly.³⁶

The apex court was of the opinion that even though the principle is not promulgated by any Articles of the Constitution of India or any other of the several environmental legislations, it can be incorporated into the domestic law as a cardinal principle of international environmental law which is not contrary to municipal laws and should be taken into account for deciding cases by the judiciary. In another case³⁷ it was held by the Hon'ble court that reversal of the burden of proof, good governance and principle of intergenerational equity are indispensable ingredients of the precautionary principle. The Supreme Court while deciding the case of *Narmada Bachao Andolan v. Union of India*³⁸ held that the precautionary principle needs to be followed in all cases of uncertainty of ecological effects. Conversely, if the effects are certain or are known, mitigating steps should be employed to contain the harmful quality as much as possible. It was also established that a mere change in the ecology should not be equated with an ecological disaster and that to counter such a claim, the defendant will need to prove the inert nature of the activity.

3.2 RECOMMENDATIONS ON BRAI BILL

The Government of India has in conformity with the provisions of the Cartagena Protocol, of which it is a signatory, proposed the promulgation of National Biotechnology Regulatory Authority through the Biotechnology Regulatory Authority of India Bill which will, subsequent to its establishment, be the supreme authority on regulations and policies that flow with the genetically modified organisms in India. The Bill proposing BRAI is yet to be passed by the parliament. However, it has met with severe oppositions from the farmers and non-governmental organisations like Greenpeace India due to several of its questionable provisions that encroach upon the legal rights of the farmers and the consumers generally. It is submitted that these conflicting provisions of the Bill be amended and alternate measures be taken to ensure the prevention of such gross violation of constitutional and legal rights. A brief account of the controversial provisions and their repercussions has been discussed below.

BRAI is abrogating the powers of the State Legislature

Section 2 of the bill avers that the Union or the parliament alongside the central government has the authority to take actions pertaining to the regulation of genetically modified organisms and associated products. In addition to Section 2 of the bill, Section 81 reinforces the stance of the former by stating that even if such an empowerment of the Union is found to be in conflict with any previously existing legislation, the law under

the Section 2 will prevail. Such provisions are explicitly against the Constitution. The Constitution expressly states that the parliament cannot legislate on matters enumerated in the State list without prior authorisation by the State Legislative Assemblies.³⁹ Item 14 of the State List (List II) provides for the state legislative assemblies to deal with matters concerning agriculture and plant diseases.⁴⁰ This goes to show that matters pertaining to the regulation of genetically modified foods and products and their mass cultivation should be monitored by the state legislature. Therefore, the provisions of the BRAI Bill are in contravention with the Constitution as they override the powers of the state legislature.

Infringement of the Right to Information

Section 27(1) of the BRAI Bill states that the information pertaining to the research and development of genetically modified organisms and transgenic foods and products shall be confidential and will not be revealed in the public sphere. This is in direct contravention to the Right to Information Act. The Right to Information Act, 2005 was passed with the intention⁴¹ of keeping the citizens of India informed about the machineries of the government and to counter corruption. This Act is a vital part of a democracy as it promotes transparency and acts as a catalyst to hold the governments and their agencies accountable to the public.

Legal Lacunae

³⁹ The Constitution of India, Art. 249(1).

⁴⁰ No. 14 of State List (List II): Agriculture, including agricultural education and research, protection against pests and prevention of plant diseases.

<https://www.mea.gov.in/Images/pdf1/S7.pdf>

Assessed 23 September 2019.

⁴¹ The Right to Information Act, 2005 (Act 22 of 2005).

Section 3 of the BRAI Bill⁴² states that the provisions of the Food Safety and Standards Act, 2006, would no longer be applicable to the genetically modified organisms and associated products covered by the Bill. This can lead to an extremely dangerous situation as the Food Safety and Standards Act provides for the explicit labelling of genetically modified foods. This oversight of an essential requirement can be catastrophic as there would no longer be any legislation affirming the need for labelling genetically modified foods. This would lead to a dire situation where the consumer, who will most likely be a layman, would be rendered inept in differentiating between transgenic and organic food and associated products. This is to be understood in the context of 'labelling' being the operative part of the consumer's 'right to choose'.⁴³

Cognizance of Offences and Lack of Jurisdiction

According to Section 70 of the Bill, all courts are universally barred from taking cognizance of any offence punishable under the Bill except when a complaint has been instituted by an authority or an authorised person under the Bill. Therefore, the department set up by the Bill cannot be challenged unless the authority feels so, ergo, they are answerable to themselves. In

addition to this, the BRAI also establishes that does not have the jurisdiction with respect to any matter which the appellate tribunal under the Bill is empowered to decide.⁴⁴ Further, no injunction can be granted by any court in respect of any action taken under the Act.⁴⁵ These provisions make the BRAI Bill almost unimpeachable as very limited space is provided for interventions and the conventional mechanisms have been completely dismantled. These issues are further amplified by the free leash provided to the adjudicatory board to be established through the Bill that will not be subject to the provisions of the Code of Civil Procedure, 1908⁴⁶ or the Indian Evidence Act, 1872⁴⁷. It is proposed that the board be regulated in accordance with the principles of natural justice.⁴⁸

4. CONCLUSION AND SUGGESTION

The use of genetically modified organisms is important in order to satisfy the expanding needs and improve existing conditions prevalent in our environment. We are at a restless crossroad where, on one hand, we are faced with unprecedented threats to human health and environment, while on the other hand we have opportunities to change the manner in which things are done.⁴⁹ Regulations concerning utilization of GMOs

need a more extensive basis for decision. Post release effects of GMOs can preventive and precautionary measures dependent on risk assessment and management. Observing and identification techniques are vital for risk assessment and the management to control the negative environmental and health impacts. The international biosafety regulatory frameworks are sufficiently stringent so as to protect against genuine ascertainable risks, as well as the ability of decision makers to discern the appropriateness of data necessary to adequately conduct a risk assessment, which all have considerable consequences.⁵⁰ Consideration of social, economic, and ethical issues needs to be taken care of. Use of the precautionary approach provides avenues for future development and use of genetic engineering.

India is a signatory to the Cartagena Protocol on Biosafety to the Convention on Biological Diversity, according to which, all signatories of the convention must enact an explicit law dealing with the regulation and release of genetically modified organisms. Keeping in conformity to this direction of the protocol, the Government of India proposed the BRAI Bill which would most likely be the future of the legal and administrative aspects of genetically modified organisms in India. However, as elucidated in the preceding section of this paper, such a governing body would be extremely autocratic and almost unimpeachable. This conflict between the Bill and the consumer's rights has given rise to an undesirable situation; the resolution of which lies in amending the aforementioned provisions of the Bill before it is passed by the parliament. Encouragement of new

monitoring and detection methods and tools is therefore vital for assessment, control of environmental, and health impacts as well as collection of ecological knowledge of relevance to future releases.
